

# Semester Project Part 1: Topic Selection

Name: DesignsByAidanMacklen

Since I began my coding journey in 2020, I wanted a very nice website for myself to showcase. I want to showcase my skills and create something I never thought I could do. I know that this is something I will continue to build off of and keep getting better with so I think this will benefit me passed this class as well. I plan on having a page for the home, portfolio (which will showcase my creations that I've created in college), About, Skills (which will be creations I've become very good at and showcase through designs I've made personally or attributes to the page itself), and finally the Contact page. My end goal with this is to showcase this to future employers as part of my application.

Page Names (5):

1. Home
2. Portfolio
3. About
4. Skills
5. Contact Me

Since this is my own portfolio, there's not too much of a need to include any login or security to the user.

However, I definitely could use a login for the administrator (me) as this is another asset that could be useful to show to employers in the future. This administrator (me), should be able to add, delete, and edit the code as I am currently able to do. I will have a section for the user to select admin, or viewer initially so that there are two paths for the user to "choose". I do plan on utilizing user info in the skills section so that there are little pieces of the page to play with to showcase my skills I have acquired along the way.
